# Low-Speed Rotary Actuator

Possible to transfer a workpiece at low-speed.
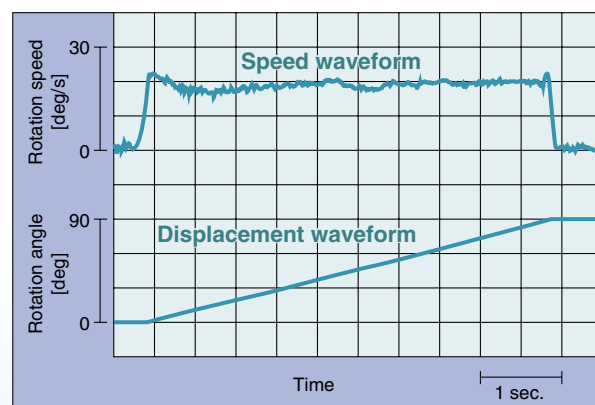

● **Rotation time adjustment range:** **1 to 5** (s/90°)

Model		Size	Rotation time adjustment range (s/90°) 1 2 3 4 5
Low-speed	**CRQ2X**	10, 15, 20, 30, 40	**1 to 5** (0.7 to 5 for CRQ2X□10,15)
	MSQX	10, 20, 30, 50	
Stand-ard	CRQ2	10, 15, 20, 30, 40	0.2 to 1 (0.2 to 0.7 for CRQ2□10,15)
	MSQ	10, 20, 30, 50	

● **Stable motion at 5s/90°.**

Smooth motion without stick-slip phenomenon.

Speed waveform

Displacement waveform

Rotation speed [deg/s]

Rotation angle [deg]

Time   1 sec.

Measurement conditions: Fluid: Air.
Mounting orientation: Horizonal without load.
Operating pressure: 0.5 MPa.
Pneumatic circuit: Meter-out circuit.
Ambient temperature: Room temperature.

● **Dimensions compatible with the CRQ2 and MSQ series**

Model Selection

∗ The selection procedure of a low-speed rotary is the same as for an ordinary rotary. If the rotation time exceeds 2s per 90°, however, the necessary torque and the kinetic energy are calculated with rotation time of 2s per 90°.

Selection Procedure	Remarks	Selection Example

0 Operating conditions

Operating conditions are as follows:
- Provisionally selected model
- Operating pressure: MPa
- Mounting position
- Load type
  Static load: N·m
  Resistance load: N·m
  Inertial load: N·m
- Load dimension: m
- Load mass: kg
- Rotation time: s
- Rotation angle: rad

- See P.3 for load type.

- The unit of the rotation angle is Radians.
  180° = π rad
  90° = $\pi/2$ rad

Provisionally selected model: MSQXB10A
Operating pressure: 0.3 MPa
Mounting position: Vertical, Type of load: Inertial load
Rotation time: 6s   Rotation angle: π rad (180°)

1 Calculation of moment of inertia

Calculate the moment of inertia of the load.

⇒ P.2

- If the moment of inertia of the load is made up of multiple components, calculate the moment of inertia of each component and add them together.

Load 1 moment of inertia: I_1
$$I_1 = 0.4 \times \frac{0.15^2 + 0.05^2}{12} + 0.4 \times 0.05^2 = 0.001833$$
Load 2 moment of inertia: I_2
$$I_2 = 0.2 \times \frac{0.025^2}{2} + 0.2 \times 0.1^2 = 0.002063$$
Total moment of inertia: I
$$I = I_1 + I_2 = 0.003896 \ [kg \cdot m^2]$$

2 Calculation of necessary torque

Calculate necessary torque corresponding to the load type, and ensure it is within effective torque range.

- Static load (Ts)
  Necessary torque T = Ts
- Resistance load (Tf)
  Necessary torque T = Tf x (3 to 5)
- Inertial load (Ta)
  Necessary torque T = Ta x 10

⇒ P.3

- When calculating the inertial load, if the rotation time exceeds 2s per 90°, inertial load is calculated with rotation time of 2s per 90°.

- Even for resistance load, when the load is rotated, necessary torque calculated from inertial load shall be added.

  Necessary torque
  T = Tf x (3 to 5) + Ta x 10

Inertial load: Ta
$Ta = I \cdot \dot{\omega}$
$\dot{\omega} = \dfrac{2\theta}{t^2} \ [rad/s^2]$
Necessary torque: T
$T = Ta \times 10$
$= 0.003896 \times \dfrac{2 \times \pi}{4^2} \times 10 = 0.015 \ [N \cdot m]$
   (t is calculated with 2s per 90°.)
0.109 N·m < Effective torque   OK

3 Checking rotation time

Confirm that it is within the adjustable range of rotation time.

⇒ P.4

- Converted to the time per 90° for comparison. (For example, 6s/180° is converted to 3s/90°.)

$1.0 \leq t \leq 5$

t = 3s/90° OK

4 Calculation of kinetic energy

Confirm that the load's kinetic energy is within the allowable value.

Confirm it with the graph of the moment of inertia and the rotation time.

⇒ P.4

- If the rotation time exceeds 2s per 90°, kinetic energy is calculated with rotation time of 2s per 90°.

- If the allowable value is exceeded, an external cushioning mechanism, such as an absorber, needs to be installed.

$E = \dfrac{1}{2} \cdot I \cdot \omega^2$
$\omega = \dfrac{2 \cdot \theta}{t}$
Kinetic energy
$E = \dfrac{1}{2} \times 0.003896 \times \left(\dfrac{2 \times \pi}{4}\right)^2 = 0.0048 \ [J]$
   (t is calculated with 2s per 90°.)
0.0048 [J] < Allowable energy   OK

5 Checking allowable load

Check if the load applied to the product is within the allowable range.

⇒ P.5

- If the allowable value is exceeded, an external bearing needs to be installed.

$M = 0.4 \times 9.8 \times 0.05 + 0.2 \times 9.8 \times 0.1$
$= 0.392 \ [N \cdot m]$

0.392 [N·m] < Allowable moment load   OK

6 Calculation of air consumption and necessary air quantity

Calculate air consumption and necessary air quantity as required. ⇒ P.6

Equation Table of Moment of Inertia (Calculation of moment of inertia I)

I: Moment of inertia (kg·m²) m: Load mass (kg)
1. Thin shaft
Position of rotational axis:
Perpendicular to the shaft through the centre of gravity
$$I = m \cdot \frac{a^2}{12}$$
2. Thin rectangular plate
Position of rotational axis:
Parallel to side b through the centre of gravity

$$I = m \cdot \frac{a^2}{12}$$

### 3. Thin rectangular plate (Including rectangular parallelepiped)
Position of rotational axis:
Perpendicular to the plate through the centre of gravity

$$I = m \cdot \frac{a^2 + b^2}{12}$$

4. Round plate
Position of rotational axis:
Passing through the centre axis

$$I = m \cdot \frac{r^2}{2}$$

5. Solid sphere
Position of rotational axis:
Passing through the diameter
$$I = m \cdot \frac{2r^2}{5}$$

6. Thin round plate
Position of rotational axis:
Passing through the diameter
$$I = m \cdot \frac{r^2}{4}$$

7. Cylindrical
Position of rotational axis:
Passing through the diameter and the centre of gravity
$$I = m \cdot \frac{3r^2 + a^2}{12}$$

8. Rotational axis and the centre of the load are not concentric.
$$I = K + m \cdot L^2$$

K: The moment of inertia around the centre of gravity of the load

In case of 4. Round plate $K = m \cdot \frac{r^2}{2}$

9. Gear transmission

(A) No. of teeth = a
(B)
No. of teeth = b

1. Find the moment of inertia I_B for the rotation of shaft (B).
2. Next, I_B is entered to find I_A the moment of inertia for the rotation of shaft (A) as:

$$I_A = \left(\frac{a}{b}\right)^2 \cdot I_B$$

SMC

Model Selection

Load Type

Necessary torque calculation method depends on the load type. Refer to the table below.

| Load type		
Static load: Ts	**Resistance load: Tf**	**Inertial load: Ta**
Only pressing force is necessary (e.g. for clamping).	Weight or friction force is applied to rotating direction.	Rotate the load with inertia.
	Gravity is applied. Friction force is applied.	Centre of rotation and centre of gravity of the load are concentric. Rotation shaft is vertical (up and down).
$Ts = F \cdot \ell$ Ts: Static load (N·m) F : Clamping force (N) ℓ : Distance from the rotation centre to the clamping position (m)	Gravity is applied in rotating direction. $Tf = m \cdot g \cdot \ell$ Friction force is applied in rotating direction. $Tf = \mu \cdot m \cdot g \cdot \ell$ Tf : Resistance load (N·m) m : Load mass (kg) g : Gravitational acceleration 9.8 (m/s^2) ℓ : Distance from the rotation centre to the point of application of the weight or friction force (m) μ : Friction coefficient	$Ta = I \cdot \omega = I \cdot \dfrac{2\theta}{t^2}$ Ta : Inertial load (N·m) I : Moment of inertia (kg·m^2) ω : Angular acceleration (rad/s^2) θ : Rotation angle (rad) t : Rotation time (s) For low speed rotary, if the rotation time exceeds 2s per 90°, inertial load is calculated with rotation time of 2s per 90°.
Necessary torque: **T** = **Ts**	Necessary torque: **T** = **Tf** x (3 to 5) [Note]	Necessary torque: **T** = **Ta** x 10 [Note]

- Resistance load: Gravity or friction force is applied to rotating direction.
  - Ex. 1) Rotation shaft is horizontal (lateral), and the rotation centre and the centre of gravity of the load are not concentric.
  - Ex. 2) Load moves by sliding on the floor

Note 1) The total of resistance load and inertial load is the necessary torque. **T** = **Tf** x (3 to 5) + **Ta** x 10
Note 2) To adjust the speed, margin is necessary for Tf and Ta.

- Not resistance load: Nor weight nor friction forces are applied in rotating direction.
  - Ex. 1) Rotation shaft is vertical (up and down).
  - Ex. 2) Rotation shaft is horizontal (lateral), and rotation centre and the centre of gravity of the load are not concentric.

Note) Necessary torque is inertial load only. **T** = **Ta** x 10

SMC

CRQ2X / **MSQX** — Effective torque (N·m) vs Operating pressure (MPa)
Note 1) Operating torque values in above table are representative values, not guaranteed. Make use of the values as a reference when ordering.

Note 2) Except for cases when an external stopper is used, the holding torque at the operation end is half of the table value.

Kinetic Energy / Rotating Time

In a rotational movement, the kinetic energy of a load may damage the internal parts, even if the required torque for a load is small. Consider the moment of inertia and rotation time before selecting a model.
(For model selection, refer to the moment of inertia and rotation time graph as shown on the table below.)

Allowable kinetic energy and rotation time adjustment range:

Set the rotation time, within stable operational guidelines, using the adjustment range specification table as detailed below.
If operating at low-speeds the rotation time adjustment range is exceeded, use caution as it may result in sticking or malfunction.

Model	Size	Allowable kinetic energy (J)	Stable operational rotation time adjustment range (s/90°)
CRQ2X	**10**	0.00025	0.7 to 5
	15	0.00039	
	20	0.025	1 to 5
	30	0.048	
	40	0.081	
MSQX	**10**	0.007	
	20	0.025	
	30	0.048	
	50	0.081	

Model Selection   Select a model based on the moment of inertia and rotation time as shown on graph below.

CRQ2X — Moment of inertia (kg·m²) vs Rotation time (s/90°): CRQ2XB□40-□, CRQ2XB□30-□, CRQ2XB□20-□, CRQ2XB□15-□, CRQ2XB□10-□

MSQX — Moment of inertia (kg·m²) vs Rotation time (s/90°): MSQXB50A, MSQXB30A, MSQXB20A, MSQXB10A
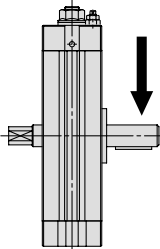

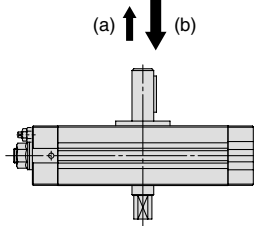

Note) If the rotation time exceeds 2s per 90°, kinetic energy is calculated with rotation time of 2s per 90°.

SMC

Model Selection

Allowable Load

CRQ2X
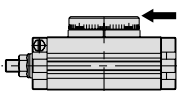

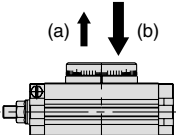

A load up to the allowable radial/thrust load can be applied. However, applications which apply a load directly to the shaft should be avoided whenever possible. In order to further improve the operating conditions, a method such as that shown in the drawing on the right side is recommended so that a direct load is not applied to the shaft.

Size	Allowable radial load (N)	Allowable thrust load (N)	
		(a)	(b)
10	14.7	7.8	15.7
15	19.6	9.8	19.6
20	49	29.4	49
30	78	49	98
40	98	59	108
MSQX

Do not allow the load and moment applied to the table to exceed the allowable values shown in the table below.
(Operation beyond the allowable values can cause adverse effects on service life, such as play in the table and loss of accuracy.)

Size	Allowable radial load (N)	Allowable thrust load (N)		Allowable moment (N·m)
		(a)	(b)	
10	78	74	78	2.4
20	147	137	137	4.0
30	196	197	363	5.3
50	314	296	451	9.7

SMC

Rotary Actuator Technical Data
Air Consumption

Air consumption is the volume of air which is expended by the rotary actuator's reciprocal operation inside the actuator and in the piping between the actuator and the switching valve, etc. This is necessary for selection of a compressor and for calculation of its running cost.

Note) The air consumption (Q_{CR}) required for one reciprocation of the rotary actuator alone is shown in the table below, and can be used to simplify the calculation.

Formulas

$$Q_{CR} = 2V \times \left(\frac{P + 0.1}{0.1}\right) \times 10^{-3}$$

$$Q_{CP} = 2 \times a \times \ell \times \left(\frac{P}{0.1}\right) \times 10^{-6}$$

$$Q_C = Q_{CR} + Q_{CP}$$

Q_{CR}	= Air consumption of rotary actuator	[ℓ (ANR)]
Q_{CP}	= Air consumption of tubing or piping	[ℓ (ANR)]
V	= Internal volume of rotary actuator	[cm³]
P	= Operating pressure	[MPa]
ℓ	= Length of piping	[mm]
a	= Internal cross section of piping	[mm²]
Q_C	= Air consumption required for one reciprocation of rotary actuator	[ℓ (ANR)]

When selecting a compressor, it is necessary to choose one which has sufficient reserve for the total air consumption of pneumatic actuators downstream. This is affected by factors such as leakage in piping, consumption by drain valves and pilot valves, etc., and reduction of air volume due to drops in temperature.

Formulas

$$Qc_2 = Qc \times n \times \text{Number of actuators} \times \text{Reserve factor}$$

Qc_2	= Compressor discharge flow rate	[ℓ/min (ANR)]
n	= Actuator reciprocations per minute	
Reserve factor: 1.5 or greater

Note) Value excluding the weight of the auto switches.

Series *MSQX*

Rotation Direction and Rotation Angle

• The rotary table turns in the clockwise direction when the A port is pressurized, and in the counter-clockwise direction when the B port is pressurized.
• By adjusting the adjustment bolt, the rotation end can be set within the range shown in the drawing for the desired rotation angle.
With Adjustment Bolt

Size	Adjustment angle per rotation of angle adjustment screw
10	10.2°
20	7.2°
30	6.5°
50	8.2°

Note) • The drawing shows the rotation range of the positioning pin hole.
• The pin hole position in the drawing shows the counter-clockwise rotation end when the adjustment bolts A and B are tightened equally and the rotation is adjusted 180°.

Rotation Angle Range Example

• Various rotation ranges are possible, as shown in the drawings below, using adjustment bolts A and B.
  (The drawings also show the rotation ranges of the positioning pin hole.)

• The rotation angle can also be set on a type with inertial absorber.

SMC

Auto Switch Specifications

Auto Switch Common Specifications

Type	Reed switch	Solid state switch
Leakage current	None	3-wire: 100 μA or less 2-wire: 0.8 mA or less
Operating time	1.2 ms	1 ms or less
Impact resistance	300 m/s^2	1000 m/s^2
Insulation resistance	50 MΩ or more at 500 VDC Mega (between lead wire and case)	
Withstand voltage	1500 VAC for 1 minute (between lead wire and case)	1000 VAC for 1 minute (between lead wire and case)
Ambient temperature	−10 to 60°C	
Enclosure	IEC60529 standard IP67, JIS C 0920 waterproof construction	
Standard	Conforming to CE Standard	

Lead Wire Length

Lead wire length indication

(Example)   **D-M9BW** L

Lead wire length

—	0.5 m
M	1 m
L	3 m
Z	5 m

Note 1) Applicable auto switch with 5 m lead wire: "Z"
Solid state switch: Manufactured upon receipt of order as standard.
Note 2) To designate solid state switches with flexible specifications, add "-61"
after the lead wire length. Flexible cable is used for D-M9□(V), D-M9□W(V), D-M9□A(V) as standard. There is no need to place the suffix -61 to the end of part number.
Note 3) 1 m (M): D-M9□W, D-M9□A(V).
Note 4) Lead wire length tolerance

Lead wire length	Tolerance
0.5 m	±15 mm
1 m	±30 mm
3 m	±90 mm
5 m	±150 mm

Contact Protection Box: CD-P11, CD-P12

<Applicable switch model>

D-A9□(V) type
The above auto switch type does not have a built-in contact protection circuit.
① **Where the operation load is an inductive load.**
② **Where the wiring length to load is greater than 5 m.**
③ **Where the load voltage is 100 VAC.**
Therefore, use a contact protection box with the switch for any of the above cases:
The contact life may be shortened (due to permanent energizing conditions). Since the solid state auto switch is a semiconductor switch which has no contacts, no contact protection box is needed.
④ **Where the load voltage is 110 VAC.**
When the load voltage is increased by more than 10% to the rating of applicable auto switches above, use a contact protection box (CD-P11) to reduce the upper limit of the load current by 10% so that it can be set within the range of the load current range.

Specifications

Part no.	CD-P11		CD-P12
Load voltage	100 VAC	200 VAC	24 VDC
Max. load current	25 mA	12.5 mA	50 mA

Connection

To connect a switch unit to a contact protection box, first connect the lead wire
from the side of the contact protection box marked SWITCH to the lead wire coming out of the switch unit. Keep the switch as close as possible to the contact protection box, with a lead wire length of no more than 1 meter.

Auto Switch Connections and Examples
Basic Wiring

Solid state 3-wire, NPN

Main switch circuit — Brown, Load, Black, Blue
(Power supplies for switch and load are separate.)

Main switch circuit — Brown, Load, Black, Blue

Solid state 3-wire, PNP

Main switch circuit — Brown, Black, Load, Blue

2-wire (Solid state)

Main switch circuit — Brown, Load, Blue

Main switch circuit — Brown, Load, Blue

2-wire (Reed switch)

Indicator light protection circuit etc. — Brown, Load, Blue ~

Indicator light protection circuit etc. — Brown, Load, Blue ~
Example of Connection to PLC (Programmable Logic Controller)

• **Sink input specification 3-wire, NPN**

Switch — Black (Input), Brown, Blue (COM)
PLC internal circuit

2-wire

Switch — Brown (Input), Blue (COM)
PLC internal circuit
• **Source input specification 3-wire, PNP**

Switch — Black (Input), Brown, Blue (COM)
PLC internal circuit

2-wire

Switch — Blue (Input), Brown (COM)
PLC internal circuit
Connect according to the applicable PLC input specifications, as the connection method will vary depending on the PLC input specifications.
Connection examples for AND (Serial) and OR (Parallel)

• **3-wire**

AND connection for NPN output (using relays)

Switch 1 — Brown, Black, Blue, Relay
Switch 2 — Brown, Black, Blue, Relay
Load — Relay contact
AND connection for NPN output (performed with switches only)

Switch 1 — Brown, Black, Blue, Load
Switch 2 — Brown, Black, Blue
The indicator lights will illuminate when both switches are turned ON.

OR connection for NPN output

Switch 1 — Brown, Black, Blue, Load
Switch 2 — Brown, Black, Blue

2-wire with 2-switch AND connection

Switch 1 — Brown, Load, Blue
Switch 2 — Brown, Blue
When two switches are connected in series, a load may malfunction because the load voltage will decline when in the ON state.
The indicator lights will illuminate if both of the switches are in the ON state.

$$\text{Load voltage at ON} = \left(\frac{\text{Power supply}}{\text{voltage}} - \frac{\text{Residual}}{\text{voltage}}\right) \times 2 \text{ pcs.}$$
$$= 24 \text{ V} - 4 \text{ V} \times 2 \text{ pcs.}$$
$$= 16 \text{ V}$$

Example: Power supply is 24 VDC.
Internal voltage drop in switch is 4 V.

2-wire with 2-switch OR connection

Switch 1 — Brown, Load, Blue
Switch 2 — Brown, Blue
(Solid state)
When two switches are connected in parallel, a malfunction may occur because the load voltage will increase when in the OFF state.

$$\text{Load voltage at OFF} = \text{Leakage current} \times 2 \text{ pcs.} \times \text{Load impedance}$$
$$= 1 \text{ mA} \times 2 \text{ pcs.} \times 3 \text{ k}\Omega$$
$$= 6 \text{ V}$$

Example: Load impedance is 3 kΩ.
Leakage current from switch is 1 mA.

(Reed)
Because there is no current leakage, the load voltage will not increase when turned OFF. However, depending on the number of switches in the ON state, the indicator lights may sometimes get dark or not light up, because of the dispersion and reduction of the current flowing to the switches.

D-A96(V)

Note) ① In case where the operation load is an inductive load.
② In case where the wiring load is greater than 5 m.
③ In case where the load voltage is 100 VAC.

Use the auto switch with a contact protection box in any of the above mentioned cases. (For details about the contact protection box, refer to page 22.)

Auto Switch Specifications

PLC: Programmable Logic Controller

D-A90/D-A90V (Without indicator light)

Auto switch part no.	D-A90	D-A90V	D-A90	D-A90V	D-A90	D-A90V
Electrical entry direction	In-line	Perpendicular	In-line	Perpendicular	In-line	Perpendicular
Applicable load	IC circuit, Relay, PLC					
Load voltage	24 VAC/DC or less		48 VAC/DC or less		100 VAC/DC or less	
Maximum load current	50 mA		40 mA		20 mA	
Contact protection circuit	None					
Internal resistance	1 Ω or less (including lead wire length of 3 m)					
Standard	Conforming to CE Standard					

D-A93/D-A93V/D-A96/D-A96V (With indicator light)

Auto switch part no.	D-A93	D-A93V	D-A93	D-A93V	D-A96	D-A96V
Electrical entry direction	In-line	Perpendicular	In-line	Perpendicular	In-line	Perpendicular
Applicable load	Relay, PLC				IC circuit	
Load voltage	24 VDC		100 VAC		4 to 8 VDC	
Load current range and max. load current	5 to 40 mA		5 to 20 mA		20 mA	
Contact protection circuit	None					
Internal voltage drop	D-A93 — 2.4 V or less (to 20 mA)/3 V or less (to 40 mA) D-A93V — 2.7 V or less				0.8 V or less	
Indicator light	Red LED illuminates when turned ON					
Standard	Conforming to CE Standard					

● Lead wires
D-A90(V)/D-A93(V) → Oilproof heavy-duty vinyl cable: ø2.7, 0.18 mm^2 x 2 cores (Brown, Blue), 0.5 m
D-A96(V) → Oilproof heavy-duty vinyl cable: ø2.7, 0.15 mm^2 x 3 cores (Brown, Black, Blue), 0.5 m
Note 1) Refer to page 22 for reed switch common specifications.
Note 2) Refer to page 22 for lead wire lengths.
Note 3) If load current is less than 5 mA, the visibility of the indicator light is decreased. If less than 2.5 mA, the light may become invisible. From the point of view of contact output, however, it is not a problem as long as the load current is more than 1 mA.

SMC

Series *CRQ2X/MSQX*
Safety Instructions

These safety instructions are intended to prevent a hazardous situation and/or equipment damage. These instructions indicate the level of potential hazard by labels of **"Caution", "Warning"** or **"Danger"**. To ensure safety, be sure to observe ISO 4414 Note 1), JIS B 8370 Note 2) and other safety practices.

■Explanation of the Labels

Labels	Explanation of the labels
⚠ **Danger**	In extreme conditions, there is a possible result of serious injury or loss of life.
⚠ **Warning**	Operator error could result in serious injury or loss of life.
⚠ **Caution**	Operator error could result in injury Note 3) or equipment damage. Note 4)

Note 1) ISO 4414: Pneumatic fluid power – General rules relating to systems
Note 2) JIS B 8370: General Rules for Pneumatic Equipment
Note 3) Injury indicates light wounds, burns and electrical shocks that do not require hospitalization or hospital visits for long-term medical treatment.
Note 4) Equipment damage refers to extensive damage to the equipment and surrounding devices.

■Selection/Handling/Applications

1. **The compatibility of the pneumatic equipment is the responsibility of the person who designs the pneumatic system or decides its specifications.**
   Since the products specified here are used in various operating conditions, their compatibility for the specific pneumatic system must be based on specifications or post analysis and/or tests to meet the specific requirements. The expected performance and safety assurance are responsibility of the person who has determined the compatibility of the system. This person should continuously review the suitability of all items specified, referring to the latest catalogue information with a view to giving due consideration to any possibility of equipment failure when configuring a system.

2. **Only trained personnel should operate pneumatically operated machinery and equipment.**
   Compressed air can be dangerous if handled incorrectly. Assembly, handling or repair of pneumatic systems should be performed by trained and experienced operators. (Understanding JIS B 8370 General Rules for Pneumatic Equipment, and other safety rules are included.)

3. **Do not service machinery/equipment or attempt to remove components until safety is confirmed.**
   1. Inspection and maintenance of machinery/equipment should only be performed after confirmation of safe locked-out control positions.
   2. When equipment is to be removed, confirm that safety process as mentioned above. Cut the supply pressure for this equipment and exhaust all residual compressed air in the system.
   3. Before machinery/equipment is restarted, take measures to prevent shooting-out of cylinder piston rod, etc. (Bleed air into the system gradually to create back pressure).

4. **Contact SMC if the product is to be used in any of the following conditions:**
   1. Conditions and environments beyond the given specifications, or if product is used outdoors.
   2. Installation on equipment in conjunction with atomic energy, railway, air navigation, vehicles, medical equipment, food and beverages, recreation equipment, emergency stop circuits, press applications, or safety equipment.
   3. An application which has the possibility of having negative effects on people, property, requiring special safety analysis.
   4. If the products are used in an interlock circuit, prepare a double interlock style circuit with a mechanical protection function for the prevention of a breakdown. And, examine the devices periodically if they function normally or not.

■Exemption from Liability

1. **SMC, its officers and employees shall be exempted from liability for any loss or damage arising out of earthquakes or fire, action by a third person, accidents, customer error with or without intention, product misuse, and any other damages caused by abnormal operating conditions.**

2. **SMC, its officers and employees shall be exempted from liability for any direct or indirect loss or damage, including consequential loss or damage, loss of profits, or loss of chance, claims, demands, proceedings, costs, expenses, awards, judgments and any other liability whatsoever including legal costs and expenses, which may be suffered or incurred, whether in tort (including negligence), contract, breach of statutory duty, equity or otherwise.**

3. **SMC is exempted from liability for any damages caused by operations not contained in the catalogues and/or instruction manuals, and operations outside of the specification range.**

4. **SMC is exempted from liability for any loss or damage whatsoever caused by malfunctions of its products when combined with other devices or software.**

Design and Selection

⚠Warning

1. Confirm the specifications.

Read the specifications carefully and use this product appropriately.

The product may be damaged or malfunction if it is used outside the range of specifications of current load, voltage, temperature or impact.

2. Pay attention to the length of time that a switch is ON at an intermediate stroke position.

When an auto switch is placed at an intermediate position of the stroke and a load is driven at the time the piston passes, the auto switch will operate. However if the speed is too great, the operating time will be shortened and the load may not operate properly. The maximum detectable piston speed is:

$$V \text{ (mm/s)} = \frac{\text{Auto switch operating range (mm)}}{\text{Load operating time (ms)}} \times 1000$$

3. Keep wiring as short as possible.

<Reed switch>

As the length of the wiring to a load gets longer, the rush current at switching ON becomes greater, and this may shorten the product's life. (The switch will stay ON all the time).

Use a contact protection box when the wire length is 5 m or longer.

<Solid state switch>

Although wire length should not affect switch function, use a wire 100 m or shorter.

If the wiring is longer it will likely increase noise (although the length is less than 100 m). In these cases, SMC recommends attaching the ferrite core to the both ends of the cable to prevent excess noise.

Since the solid state auto switch is a semiconductor switch which has no contacts, no protection box is needed.

4. Do not use a load that generates surge voltage.

<Reed switch>

If driving a load such as a relay that generates a surge voltage, use a switch with a built-in contact protection circuit or use a contact protection box.

<Solid state switch>

Although a zener diode for surge protection is connected at the output side of a solid state auto switch, damage may still occur if the surge is applied repeatedly. When a load, such as a relay or solenoid, which generates surge is directly driven, use a type of switch with a built-in surge absorbing element.

5. Cautions for use in an interlock circuit

When an auto switch is used for an interlock signal requiring high reliability, devise a double interlock system to avoid trouble by providing a mechanical protection function, or by also using another switch (sensor) together with the auto switch. Also perform periodic maintenance and confirm proper operation.

6. Do not make any modifications (including exchanging the printed circuit boards) to the product.

It may cause human injuries and accidents.

⚠Caution

1. Take precautions when actuators are used close together.

When multiple auto switch actuators are used in close proximity magnetic field interference may cause the switches to malfunction. Maintain a minimum actuator separation of 40 mm. (When the allowable separation is indicated for each actuator series, use the specified value.)

Use of a magnetic screen plate (MU-S025) or magnetic screen tape can reduce the interference of magnetic force.

2. Take note of the internal voltage drop of the auto switch.

<Reed switch>

1) Auto switches with an indicator light (Model D-A96(V))
   - If auto switches are connected in series as shown below, take note that there will be a large voltage drop because of internal resistance in the light emitting diodes. (Refer to internal voltage drop in the auto switch specifications.)
   [The voltage drop will be "n" times larger when "n" auto switches are connected.]
   Even though an auto switch operates normally, the load may not operate.
   - In the same way, when operating under a specified voltage, although an auto switch may operate normally, the load may not operate. Therefore, the formula below should be satisfied after confirming the minimum operating voltage of the load.

$$\frac{\text{Supply}}{\text{voltage}} - \frac{\text{Internal voltage}}{\text{drop of switch}} > \frac{\text{Minimum operating}}{\text{voltage of load}}$$

2) If the internal resistance of a light emitting diode causes a problem, select a switch without an indicator light (Model D-A90).

<Solid state switch>

3) Generally, the internal voltage drop will be greater with a 2-wire solid state auto switch than with a reed switch. Take the same precautions as in 1).
   Also, note that a 12 VDC relay is not applicable.

Series CRQ2X/MSQX
Auto Switches
Precautions 2

Be sure to read this before handling.

Design and Selection

⚠️Caution

3. Pay attention to leakage current.

<Solid state switch>

With a 2-wire solid state auto switch, current (leakage current) flows to the load to operate the internal circuit even when in the OFF state.

$$\text{Operating current of load (OFF condition)} > \text{Leakage current}$$

If the criteria given in the above formula are not met, it will not reset correctly (stays ON). Use a 3-wire switch if this specification will not be satisfied.

Moreover, leakage current flow to the load will be "n" times larger when "n" auto switches are connected in parallel.

4. Ensure sufficient space for maintenance activities.

When designing an application, be sure to allow sufficient space for maintenance and inspections.

5. Minimum stroke for auto switch mounting.

The minimum stroke value for mounting one or two auto switches is obtained once the switch detects the cylinder stroke ends.

However, even if the switch is mounted at the proper position within the minimum stroke range, it may not be able to detect when the piston stops in the middle of the stroke due to a stopper, etc. It may also turn on in the middle of a stroke.

6. When multiple auto switches are required.

"n" indicates the number of switches that can be physically mounted. Detection intervals depend on the switch mounting structure and set position therefore some required interval and set positions may not be available.

7. Limitations of detectable positioning.

When using certain mounting brackets, the surface and position where an auto switch can be mounted could be restricted due to physical interference (bottom side of foot bracket etc.).

Please select the set position of the auto switch so that it does not interfere with the mounting bracket of the cylinder (trunnion or support ring etc.).

8. Use the cylinder and switch in proper combination.

The auto switch is pre-adjusted to activate properly for an auto-switch-capable SMC cylinder.

If the auto switch is mounted improperly, or used for another cylinder series, the switch may not activate properly.

Mounting and Adjustment

⚠️Warning

1. Operating manual

Install the products and operate them only after reading the operating manual carefully and understanding its contents. Also keep the manual where it can be referred to if necessary.

2. Do not drop or bump.

Do not drop, bump or apply excessive impacts (300 m/s² or more for reed switches and 1000 m/s² or more for solid state switches) while handling. Although the body of the auto switch may not be damaged, the inside of the auto switch could be damaged and cause a malfunction.

3. Mount auto switches using the proper fastening torque.

When a switch is tightened beyond the range of fastening torque, the mounting screws, auto switches, and mounting bracket, may be damaged. On the other hand, tightening below the range of fastening torque may allow the switch to slip out of position. (Refer to auto switch mounting for each series regarding auto switch mounting, moving, and fastening torque, etc.)

4. Mount an auto switch at the center of the operating range.

Adjust the mounting position of an auto switch so that the piston stops at the center of the operating range (the range in which a switch is ON). (The mounting positions shown in a catalogue indicate the optimum positions at stroke end.) If mounted at the end of the operating range (around the borderline of ON and OFF), operation may be unstable.

<D-M9□>

When the auto switch is used to replace an old series auto switch, it may not activate depending on operating condition because of its shorter operating range.

Such as:

- **Application where the stop position of actuator may vary and exceed the operating range of the auto switch, for example, pushing, pressing, clamping operation, etc.**
- **Application where the auto switch is used for detecting an intermediate stop position of the actuator. (In this case the detecting time will be reduced.)**

In these applications, set the auto switch to the center of the required detecting range.

5. Secure the space for maintenance.

When installing the products, please consider access for maintenance.

⚠️Caution

1. Do not carry an actuator by the auto switch lead wires.

Never carry a rotary actuator by its lead wires, as this may not only cause broken lead wires, but it may cause internal elements of the auto switch to be damaged by the stress.

2. Fix the auto switch with appropriate screw installed on the auto switch body. If using other screws, auto switch may be damaged.

SMC

Wiring

⚠️Warning

1. Confirm proper insulation of wiring.

Be sure there is no faulty wiring insulation (contact with other circuits, ground fault, improper insulation between terminals, etc.). Damage may occur due to excess current flow into a switch.

2. Do not wire with power lines or high-voltage lines.

Wire separately from power lines or high-voltage lines, avoiding parallel wiring or wiring in the same conduit with these lines. Control circuits, including auto switches, may malfunction due to noise from those other lines.

⚠️Caution

1. Avoid repeatedly bending or stretching lead wires.

Broken lead wires will result from applying bending stress or stretching force to the lead wires.

2. Be sure to connect the load before power is applied.

<2-wire type>
If the power is turned ON when an auto switch is not connected to a load, the switch will be instantly damaged because of excess current.

3. Do not allow short circuit of loads.

<Reed switch>
If the power is turned ON with a load in a short circuited condition, the switch will be instantly damaged because of excess current flow into the switch.

<Solid state switch>
Model D-M9□(V) except D-M9□W(V) and all models of PNP output type switches do not have built-in short circuit protection circuits. As in the case of reed switches, if loads are short circuited, the switches will be instantly damaged.
Take special care to avoid reverse wiring with the brown power supply line and the black output line on 3-wire type switches.

⚠️Caution

4. Avoid incorrect wiring.

<Reed switch>
A 24 VDC switch with indicator light has polarity. The brown lead wire is (+) and the blue lead wire, or the second terminal, is (–).

1) If connections are reversed, a switch will operate, however, the light emitting diode will not light up.
Also note that a current greater than that specified will damage a light emitting diode and it will no longer operate.
Applicable models: D-A93, D-A54

<Solid state switch>
1) If connections are reversed on a 2-wire type switch, the auto switch will not be damaged if protected by a protection circuit, but the switch will stay in an ON state.
However, it is still necessary to avoid reversed connections, since the auto switch could be damaged by a load short circuit in this condition.

2) If connections are reversed (power supply line + and power supply line –) on a 3-wire type switch, the switch will be protected by a protection circuit. However, if the power supply line (+) is connected to the blue wire and the power supply line (–) is connected to the black wire, the auto switch will be damaged.

<D-M9□>
The D-M9□ does not have built-in short circuit protection circuit. Be aware that if the power supply connection is reversed (e.g. (+) power supply wire and (–) power supply wire connection is reversed), the auto switch will be damaged.

5. When the cable sheath is stripped, confirm the stripping direction. The insulator may be split or damaged depending on the direction. (D-M9□ only)
Recommended Tool

Model name	Model no.
Wire stripper	D-M9N-SWY

∗ Stripper for a round cable (ø2.0) can be used for a 2-wire type cable.
Series *CRQ2X/MSQX*
Auto Switches
Precautions 4

Be sure to read this before handling.

⚠Warning

1. Never use in an atmosphere of explosive gases.

The construction of auto switches is not intended to prevent explosion. Never use in an atmosphere with an explosive gas since this may cause a serious explosion.

2. Do not use in an area where a magnetic field is generated.

Auto switches will malfunction or magnets inside actuators will become demagnetized. (Consult SMC regarding the availability of a magnetic field resistant auto switch).

3. Do not use in an environment where the auto switch will be continually exposed to water.

Although switches, except some models, satisfy IEC standard IP67 construction (JIS C 0920: waterproof construction), do not use switches in applications where continually exposed to water splash or spray. Poor insulation or swelling of the potting resin inside auto switches may cause malfunction.

4. Do not use in an environment with oil or chemicals.

Consult with SMC if auto switches will be used in an environment with coolant, cleaning solvent, various oils or chemicals. If auto switches are used under these conditions for even a short time, they may be adversely affected by improper insulation, malfunction due to swelling of the potting resin, or hardening of the lead wires.

5. Do not use in an environment with temperature cycles.

Consult with SMC if switches are used where there are temperature cycles other than normal temperature changes, as they may be adversely affected internally.

6. Do not use in an environment where there is excessive impact shock.

<Reed switch>

When excessive impact (300 m/s^2 or more) is applied to a reed switch during operation, the contact point will malfunction and generate or cut off a signal momentarily (1 ms or less). Consult SMC regarding the need to use a solid state switch depending upon the environment.

7. Do not use in an area where surges are generated.

<Solid state switch>

When there are units (solenoid type lifter, high-frequency induction furnace, motor, radio equipment etc.) which generate a large amount of surges or electromagnetic waves in the area around actuators with solid state auto switches, this may cause deterioration or damage to the internal circuits elements of the switches. Avoid sources of surge generation and disorganized lines.

⚠Caution

1. Avoid accumulation of iron debris or close contact with magnetic substances.

When a large amount of ferrous debris such as machining chips or spatter, is accumulated, or a magnetic substance is brought into close proximity with an auto switch actuator, it may cause the auto switch (actuator) to malfunction due to a loss of the magnetic force inside the actuator.

2. Consult SMC concerning water resistance, elasticity of lead wires, use at welding sites, etc.

3. Do not use in environments with direct sunlight.

4. Do not mount the product in locations exposed to radiant heat.

⚠Warning

1. Perform the following maintenance periodically in order to prevent possible danger due to unexpected auto switch malfunction.

1) Secure and tighten auto switch mounting screws.
   If screws become loose or the mounting position is dislocated, retighten them after readjusting the mounting position.

2) Confirm that there is no damage to lead wires.
   To prevent faulty insulation, replace auto switches or repair lead wires, etc., if damage is discovered.

3) Confirm the lighting of the green light on the 2-colour indicator type auto switch.
   Confirm that the green LED is on when stopped at the established position. If the red LED is on, the mounting position is not appropriate. Readjust the mounting position until the green LED lights up.

2. Maintenance procedures are outlined in the operation manual.

Not following proper procedures could cause the product to malfunction and could lead to damage to the equipment or machine.

3. Removal of equipment, and supply/exhaust of compressed air.

Before any machinery or equipment is removed, first ensure that the appropriate measures are in place to prevent the fall or erratic movement of driven objects and equipment. Then cut off the electric power and reduce the pressure in the system to zero. Only then you should proceed with the removal of any machinery and/or equipment.
When machinery is restarted, proceed with caution after confirming that appropriate measures are in place to prevent actuators from sudden movement.

SMC

⚠

Selection

⚠Caution

1. Changes in speed occur in applications where there are changes in the load during operation, such as the load being lifted (lowered) against gravity.

2. The purpose of this product is to provide stable rotation at low-speed.

It does not provide any function to cushion the impact at the operation start or end.

3. Speed may vary at the rotation end depending on operating conditions. (This phenomenon can be avoided by using an external stopper.)

Air Supply

⚠Caution

1. Do not use at dew point of -60°C or lower.

Operation at dew point of -60°C or lower may adversely affect the lubricant used inside the switch and can lead to operation failure.
